

Why Organic Evolution is not scientific

This report is about why evolution is not scientific.

Natural Selection is the main way people think Evolution happened. Natural Selection is the process by which natural forces cause living organisms through a period of many generations to lose un-beneficial features while retaining beneficial ones. Natural Selection explains how an animal or plant changes to match their environment but not how the first plant or animal got there or how the plants or animals change into another type of animal. Also Evolution demands that the best naturally survive, but you still have to weed your garden don't you.

Mutations are also a way some people think Evolution happens. Mutations are mistakes in DNA. DNA is the code for making protein. When a mistake occurs in the DNA you get things like people with sickle cell anemia. Even though people with sickle cell anemia are resistant to malaria, if they can't get enough air because of choking or something their blood turns into a sickle shape and cuts up their veins. Evolutionists believe that mutations caused one thing to turn into another thing that was better. But there are no examples whatsoever of any mutations being good.

"Missing Links" are some "proofs" that evolutionists use. Here are some "Missing Links" Java Man: Java Man was used for more than thirty years! They said he walked erect and had a tail. He was supposedly made from a "perfect skull" which turned out to be a knee bone of an extinct elephant! Nebraska man: a whole race of men was invented from one tooth, one pig's tooth! Zinjanthropus: Dr. Leakey to have discovered a "remarkably well preserved skull" believed to be another human race. But that skull was in 400 pieces and was latter found to be a non-human vegetarian. Pitldown Man: for 41 years evolutionists claimed he was "one of a primitive race of humans!" Then the founder of Pitldown Man confessed that it was a fake designed to make himself famous.

Evolution can't explain how much salt and mud is in the ocean because there should be much more salt and mud because the rivers and streams bring it to the ocean all the time. Bent rock layers are another proof against evolution. Evolutionists believe that each rock layer took thousands of years to form. This means that lower layers have already become hard before upper layers are started. However some rocks that are many layers thick are bent. But rocks don't bend, they break. So it would have to have been bent while it was still soft. Also there are ancient dinosaurs drawings in caves which proves that those ancient people saw dinosaurs and evolutionists claim that people and dinosaurs missed each other by 6,000,000 years.
